

ISO Customized Containers

Technical data sheet

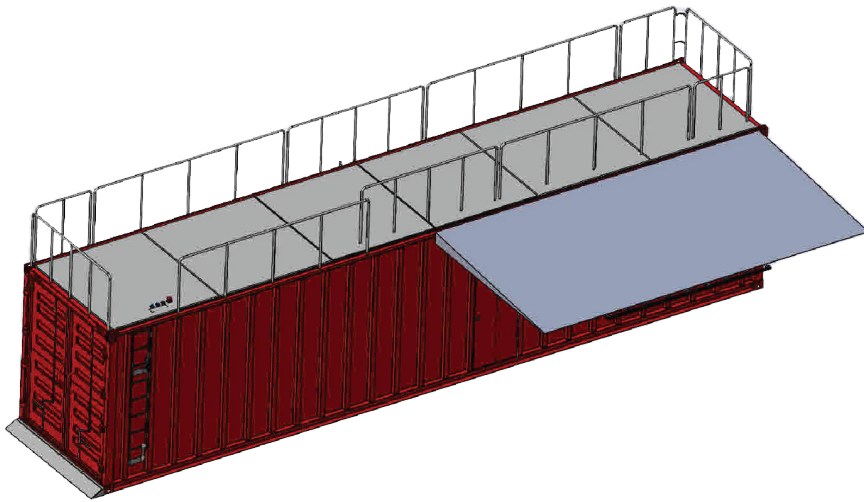

ISO Customized Containers are intended for the transportation, storage and deployment of any rescue, military, and emergency equipment. The certified lifting points and forklift pockets allow to move the containers by truck, vessel, or helicopter. ISO Containers range from 10" wide up to 40" wide, and have options as doors on one side, doors on both sides, curtain sided and many more. The containers can be equipped with several door access options, retractable roof, hydraulically operated lifting systems, air conditioning, heating, and wide variety of different furnishing options. Arete can tailor the container to suit customer needs.

ISO Customized Containers

Technical data sheet

Despite transportation of the equipment, containers are perfectly designed for storage and deployment of any equipment. All outside colours and signages are optional and can be easily customized. Arete designs and produces the container fit-out depending on individual requirements. The container can be fitted to a specially made trailer or on a heavy truck using forklift system and transported to the accident scene. Once the container arrives at the accident place, it can be easily raised. If this option is not required, then the container could remain on the trailer and the ramps and fold down floors can be used.

Key Facts

Variety of roller shutter doors

Lockable and tracable GPS

Various colours and logos can be fitted

Fully opening side door option

Standard ISO or DNV rated

Air conditioning and heating options

ISO Customized Containers
